Chiropractic Quality Standard

Acute Neck Pain
About The Royal College of Chiropractors’ Quality Standards

Quality Standards are tools designed to help deliver the best possible outcomes for patients. They are a series of specific, concise quality statements with associated measures that provide aspirational, but achievable, markers of high-quality patient care covering the treatment of different conditions. They also form an important part in addressing the increasing priority being placed on improving quality and patient outcomes.

The primary purpose of The Royal College of Chiropractors’ quality standards is to make it clear what quality care is by providing patients, the public, healthcare professionals, commissioners and chiropractors with definitions of high-quality chiropractic care.

By providing a clear description of what a high-quality service looks like, clinics can improve quality and achieve excellence. The quality standards encompass statutory requirements, best practice and existing clinical guidelines, but they are not a new set of targets or mandatory indicators for performance management. They are, however, a useful source to form the basis of clinical audit and to identify priorities for future improvement.

Chiropractors are encouraged to adopt the Royal College of Chiropractors quality standards as practice policy. They can be used in a wide range of circumstances, such as a source of identifying CPD, promoting the services that you provide, tendering for NHS contracts, or education at a local and national level. They enable Healthcare professionals to understand the standard of service that you provide, and allow commissioners to be confident that the services they are purchasing are of high quality. Importantly, they also help patients to understand what service they should expect.

Quality Statements

1. On contacting a chiropractic clinic, patients seeking care for acute neck pain are offered an appointment within three working days.

2. Patients presenting with acute neck pain are assessed on the basis of a full history, a questionnaire about interferences with daily activities, and the findings of a clinical examination, which includes an appropriate neurological assessment.

3. Routine diagnostic imaging (including x-rays, CT or MRI) is not required for patients presenting with acute neck pain, but should be formally considered if onset was traumatic.

4. Patients with acute neck pain are given an explanation of their condition, the likely causal factors, details of different treatment options, and the expected prognosis.

5. A plan of acute care is formulated in partnership with patients presenting with acute neck pain after their personal goals, expectations and concerns have been considered. The plan of acute care includes a formal review within two weeks of the commencement of treatment.

6. Patients with acute neck pain are asked to consent to treatment after they have received an explanation of the risks and benefits of treatment, the likely outcomes with and without treatment, and a plan of acute care has been agreed.

7. Patients with acute neck pain are recommended early treatment to prevent long-term disability.

8. The aims of treatment for patients with acute neck pain are to reduce symptoms, regain function and return the patient to their normal daily activities (including work), subject to the patients’ personal expectations and preferences.

9. Patients with acute neck pain are given options for short-term pain relief and treated with a package of care, including manipulation and/or mobilisation, soft tissue therapies, exercise and lifestyle advice, cognitive behaviour interventions, and encouragement to remain as active as possible.

10. Patients with acute neck pain whose symptoms are either progressing or very severe are assessed at least twice a week.

11. Subject to receiving consent, one or more reports are sent to the GPs of patients with acute neck pain detailing their presentation, diagnosis and response to treatment.

12. Patients with acute neck pain are regularly assessed and referred to another healthcare practitioner if their condition shows no sign of improvement within four weeks.

13. Patients with acute neck pain are discharged from acute care within four weeks of their signs and symptoms being absent.

14. Following an evaluation of prognostic factors, ongoing rehabilitation and prophylactic care may be offered to patients following discharge from treatment for acute neck pain.
**Scope of Quality Standard**

This quality standard covers the chiropractic management of patients with Type I and Type II neck pain (described by The Bone and Joint Decade Task Force on Neck Pain as not being associated with radiculopathy or serious pathology) of less than 6 weeks in duration. This is often referred to as simple, mechanical, or non-specific acute neck pain.

Type I and Type II acute neck pain encompasses a large number of different onsets, presentations, and sources of pain. These quality statements are therefore general, but nevertheless provide aspirational, but achievable, markers of high-quality, cost-effective patient care.

**Quality Measures**

The quality measures accompanying each quality standard aim to improve the structure, process and outcomes of care. They are not a new set of targets or mandatory indicators for performance management, but might be used to form the basis of future audit. They also specify what each statement means to each stakeholder (provider, commissioners, patients).

**Chiropractic Quality Statement 2: History and Examination**

### Quality Statement

Patients presenting with acute neck pain are assessed on the basis of a full history, a questionnaire about interferences with daily activities, and the findings of a clinical examination, which includes an appropriate neurological assessment.

### Structure

Evidence of practice policy regarding patient questionnaires, history taking and clinical examination procedures for patients with acute neck pain, including assessment for Red Flags (indicators of serious spinal pathology) and Yellow Flags (psychosocial factors highlighting the risk of chronicity).

### Process

1) Proportion of patients presenting with acute neck pain having completed a questionnaire about interferences with daily activities.

**Numerator**: the number of patients in the denominator that have completed a questionnaire about interferences with daily activities.

**Denominator**: the total number of patients presenting with Type I or Type II acute neck pain.

2) Proportion of patients presenting with acute neck pain having a record in their clinical notes that a full history and examination has taken place.

**Numerator**: the number of patients in the denominator in which a full history and clinical examination has been recorded in the patient’s notes.

**Denominator**: the total number of patients presenting with Type I or Type II acute neck pain.

### Source

- GCC Standard of Proficiency (S2.2, S2.3) [http://www.gcc-uk.org/page.cfm?page_id=15]
# Chiropractic Quality Statement 3: Diagnostic Imaging

## Quality Statement

Routine diagnostic imaging (including x-rays, CT or MRI) is not required for patients presenting with acute neck pain, but should be formally considered if onset was traumatic.

## Quality Measure

**Structure:** Evidence of practice policy (including decision rules for traumatic onset such as the NEXUS Low-Risk Criteria or Canadian Cervical Spine Rule) with regard to the use of diagnostic imaging for patients presenting with acute neck pain.

**Process:**

1) Proportion of patients with acute neck pain receiving diagnostic imaging.

**Numerator:** the number of patients in the denominator having received diagnostic imaging.

**Denominator:** the total number of patients presenting with Type I or Type II acute neck pain.

2) Proportion of patients with traumatic onset acute neck pain, for which there is documentary evidence of a reasonable clinical justification for a diagnostic imaging procedure having been performed (eg. NEXUS Low-Risk Criteria or Canadian Cervical Spine Rule).

**Numerator:** the number of patients in the denominator with a reasonable clinical justification for a diagnostic imaging procedure to have been performed.

**Denominator:** the total number of patients presenting with traumatic onset Type I or Type II acute neck pain.

## Description of what the quality statement means for each audience

**Service Providers** should ensure that diagnostic imaging tests are not requested routinely for patients with acute neck pain, but only used with specific individual clinical justification (eg. complying with decision tools such as the NEXUS Low-Risk Criteria or Canadian Cervical Spine Rule).

**Commissioners** should not expect diagnostic imaging to be a standard procedure for patients with acute neck pain, but that Service Providers would have policies in place to determine in which patients imaging might be required.

**Patients** with acute neck pain should not expect to have an x-ray or scan of their neck, but that it would be considered if the onset of their pain had been traumatic.

## Source

GCC Standard of Proficiency (S2.4) [http://www.gcc-uk.org/page.cfm?page_id=15]

Chiropractic Quality Statement 4: Patient Explanations

 Patients with acute neck pain are given an explanation of their condition, the likely causal factors, details of different treatment options, and the expected prognosis.

Structure: Evidence of practice policies relating to the communication to patients with acute neck pain of the details of their condition, including causes, proposed treatment and expected prognosis.

Process: Proportion of patients with acute neck pain who have received an explanation of their condition, the likely causal factors, any proposed treatment, and the expected prognosis.

Numerator: the number of patients in the denominator who have been given an explanation of their condition, the likely causal factors, any proposed treatment, and the expected prognosis.

Denominator: the total number of patients presenting with Type I or Type II acute neck pain.

Service Providers should ensure that appropriate time is allocated to give accurate, relevant and clear information to patients with acute neck pain about their condition, the likely causal factors and any proposed treatment, together with the expected prognosis.

Commissioners should seek evidence from Service Providers that patients with acute neck pain are given an explanation of their condition and any proposed treatment, together with the expected prognosis.

Patients with acute neck pain should expect to be given an explanation of their condition and what may have caused it, together with details of any proposed treatment and the likely outcome.

# Chiropractic Quality Statement 5: Plan of Care

## Quality Statement

A plan of acute care is formulated in partnership with patients presenting with acute neck pain after their personal goals, expectations and concerns have been considered. The plan of acute care includes a formal review within two weeks of the commencement of treatment.

## Structure

Evidence of practice policies and procedures with regard to management plans, the consideration of the patients’ personal goals, expectations and concerns, and the inclusion of formal reviews.

## Process

1) Proportion of patients with acute neck pain who have received a plan of acute care, after having their personal goals, expectations and concerns taken into consideration.

**Numerator:** the number of patients in the denominator who have received a plan of acute care, after having their personal goals, expectations and concerns taken into consideration.

**Denominator:** the total number of patients presenting with Type I or Type II acute neck pain.

2) Proportion of patients with acute neck pain who have had their plan of acute care reviewed within two weeks of the commencement of treatment.

**Numerator:** the number of patients in the denominator who have received a plan of acute care review within two weeks of the commencement of treatment.

**Denominator:** the total number of patients presenting with Type I or Type II acute neck pain.

## Service Providers

Service Providers should have the systems in place to ensure that the personal goals, expectations and concerns of patients with acute neck pain are taken into consideration before a plan of acute care is formulated, in partnership with patients, which will include a formal review within two weeks of the commencement of treatment.

## Commissioners

Commissioners should expect to see evidence that the personal goals, expectations and concerns of patients with acute neck pain are taken into consideration before a plan of acute care is formulated, in partnership with patients, which will include a formal review within two weeks of treatment commencing.

## Patients

Patients with acute neck pain should expect to have their personal goals, expectations and concerns taken into consideration before taking part in formulating a plan of acute care, which will include a formal review within two weeks of starting treatment.

Chiropractic Quality Statement 6: Informed Consent

**Quality Statement**

Patients with acute neck pain are asked to consent to treatment after they have received an explanation of the risks and benefits of treatment, the likely outcomes with and without treatment, and a plan of acute care has been agreed.

**Structure**: Evidence of practice policies relating to consent, and the information supplied to patients prior to consent being sought.

**Process**: Proportion of patients with acute neck pain that have consented to treatment following an explanation of the risks, benefits and likely outcomes, and once a plan of acute care has been agreed.

**Numerator**: the number of patients in the denominator who have consented to treatment following an explanation of the risks, benefits and likely outcomes, and after agreeing a plan of acute care.

**Denominator**: the total number of patients presenting with Type I or Type II acute neck pain.

**Description of what the quality statement means for each audience**

**Service Providers** should ensure that the risks, benefits and likely outcomes have been explained to patients with acute neck pain, and a plan of acute care agreed, prior to consent to treatment being requested and documented.

**Commissioners** need to ensure that Service Providers have a consent policy in place, in which patients with acute neck pain are given information about the risks, benefits, and likely outcomes of treatment, and an agreed plan of acute care, prior to consent being given.

**Patients** with acute neck pain should expect to be given information about the risks and benefits of treatment, the likely outcomes both with and without treatment, and have agreed a plan of acute care, before being asked to consent to receiving treatment.

- GCC Code of Practice (B1, B3, B5) [http://www.gcc-uk.org/page.cfm?page_id=15]
Patients with acute neck pain are given options for short-term pain relief and treated with a package of care, including manipulation and/or mobilisation, soft tissue therapies, exercise and lifestyle advice, cognitive behaviour interventions, and encouragement to remain as active as possible.

**Structure:** Evidence of practice policy on the provision of options for short-term pain relief, as well as a package of care for the treatment of acute neck pain to include activity and lifestyle advice, manipulation and/or mobilisation, soft tissue therapies, and cognitive behavioural intervention.

**Process:**

1) Proportion of patients with acute neck pain whose management has included options for short-term pain relief.

**Numerator:** the number of patients in the denominator whose management has included options for short-term pain relief.

**Denominator:** the total number of patients presenting with Type I or Type II acute neck pain.

2) Proportion of patients with acute neck pain who are treated with a package of care, including activity and lifestyle advice, manipulation and/or mobilisation, soft tissue therapies, and cognitive behavioural intervention.

**Numerator:** the number of patients in the denominator who receive activity and lifestyle advice, manipulation and/or mobilisation, soft tissue therapies, and cognitive behavioural intervention.

**Denominator:** the total number of patients presenting with Type I or Type II acute neck pain.

**Service Providers** should address options for short-term pain relief, and provide a package of care for the treatment of acute neck pain to include activity and lifestyle advice, manipulation and/or mobilisation, soft tissue therapies, and cognitive behavioural intervention.

**Commissioners** should seek evidence that acute neck pain patients are provided options for short-term pain relief, and treated with a package of care, including activity and lifestyle advice, manipulation and/or mobilisation, soft tissue therapies, and cognitive behavioural intervention.

**Patients** with acute neck pain should expect to be given options for short-term pain relief, and treated with a number of different techniques including being given advice on activity and lifestyle, manipulation and/or mobilisation, soft tissue therapies, and addressing the psychological and social implications associated with neck pain.
