

# Chiropractic Quality Standard

## Chronic Pain

The Royal College of  
**Chiropractors**

### Scope of Quality Standard

This quality standard covers the chiropractic management of patients with chronic pain. As defined by the British Pain Society, this document uses the term *chronic pain* to mean persistent pain beyond the time that tissue healing would normally be expected, taken as beyond 3 months. This is the most widely used and recognised term, although it is acknowledged that this is not the only term and there are sound arguments to justify the use of alternative terms such as long-term pain, persistent pain and complex pain <sup>(1)</sup>.

Chronic Pain is a long-term condition where patients have ongoing persistent or episodic pain. An estimated 14 million people in the UK suffer with chronic pain. Of all people consulting in primary care, approximately 30% of them attend for help with pain. Half of these contacts relate to chronic or recurring pain, and two thirds are about musculoskeletal conditions <sup>(38)</sup>.

Chronic pain is often an integral component of a range of different musculoskeletal conditions that present to chiropractors. These quality statements are therefore general but nevertheless provide aspirational but achievable markers of high-quality, cost effective patient care.

### Quality Measures

The quality measures accompanying each quality standard aim to improve the structure, process and outcomes of care. They are not a new set of targets or mandatory indicators for performance management, but might be used to form the basis of future audit. They also specify what each statement means to each stakeholder (provider, commissioners, patients).

## **About the Royal College of Chiropractors' Quality Standards**

Quality Standards are tools designed to help deliver the best possible outcomes for patients. They are a series of specific, concise quality statements with associated measures that provide aspirational, but achievable, markers of high-quality patient care covering the treatment of different conditions. They also form an important part in addressing the increasing priority being placed on improving quality and patient outcomes.

The primary purpose of The Royal College of Chiropractors' quality standards is to make it clear what quality care is by providing patients, the public, healthcare professionals, commissioners and chiropractors with definitions of high-quality chiropractic care.

By providing a clear description of what a high-quality service looks like, clinics can improve quality and achieve excellence. The quality standards should encompass statutory requirements, best practice and existing clinical guidelines, but they are not a new set of targets or mandatory indicators for performance management. They are, however, a useful source to form the basis of clinical audit and to identify priorities for future improvement.

Chiropractors are encouraged to adopt the Royal College of Chiropractors' quality standards as practice policy. They can be used in a wide range of circumstances, such as a source of identifying CPD, or clinic promotion, perhaps when tendering for NHS contracts, or even at a national level. They enable Healthcare professionals to understand the standard of service that you provide, and allow commissioners to be confident that the services they are purchasing are of high quality. Importantly, they also help patients to understand what service they should expect.

## Quality Statements

- 1. Identification:** Patients with a history of pain ongoing for more than 3 months (and which persists beyond the time that tissue healing would normally be expected) are identified, assessed and managed with chronic pain as a distinct component of their diagnosis.
- 2. History and Examination:** A thorough history and examination should be conducted on all patients presenting with chronic pain. Assessments are multidimensional, including a biomedical pain assessment, a functional assessment and a psychological evaluation.
- 3. Psychosocial Assessment:** The assessment of patients with chronic pain includes the identification of psychosocial risk factors relating to attitudes and beliefs, behaviours, compensation, diagnosis, emotions, family, and work. This is assessed by collaborative history taking, the use of questionnaires, and screening or stratification tools.
- 4. Education:** Patients with chronic pain should be given information relating to pain physiology, the relationship between psychology and pain (including fear and avoidance, stress, distress, and depression), safety and risk in relation to increased activity, and the importance of self-management approaches and lifestyle changes.
- 5. Patient-Centred Care:** Patients with chronic pain have the opportunity to discuss their health beliefs, concerns and preferences to inform their care. Patients are given the best available evidence, are actively involved in shared decision-making, and are supported to make fully informed choices about investigations, treatment and care that reflect what is important to them.
- 6. Plan of Care:** Patients with chronic pain are active participants in the development of individualised care plans aimed at changing pain behaviour and improving function, as well as seeking pain relief. The plan should include goal setting that is patient driven and realistic, with return to work a priority (if appropriate).
- 7. Package of Care:** Patients with chronic pain are treated with an individualised package of care, which includes advice and information, exercises and psychosocial interventions. Treatment may also include manual therapies, rehabilitation, and acupuncture.
- 8. Psychological Interventions:** Patients with chronic pain are managed with a broad range of cognitive and behavioural interventions to address the impact of distressing, misleading, or restricting thoughts and beliefs. Goal-orientated techniques are used with the aim of changing thinking, mood and behaviour to increase control over pain.
- 9. Supportive Self-Management:** Patients with chronic pain are given information and support to engage in self-management strategies that may include exercise, relaxation, coping strategies, biofeedback techniques, pacing, sleep management, self-help resources, and graded exposure to social and physical activities guided by agreed goals.
- 10. Monitoring and Reassessment:** The needs of patients with chronic pain are continually kept under review and their care plans amended as necessary. Regular formal reassessments are carried out, at least every six months, with the use of validated outcome measures to assess pain, functional disability, psychosocial factors, and quality of life.
- 11. Integration of Service:** When managing patients with chronic pain, chiropractors are attentive to the involvement of other health professionals, the medications that patients are taking, and write detailed reports on their findings and management to the patient's GP. Chiropractors recognise their own limitations in pain management, and refer to other healthcare professionals, or specialist interdisciplinary pain management teams, as appropriate.

## Chiropractic Quality Statement 1: Identification

<b>Quality Statement</b>	<p><b>Patients with a history of pain ongoing for more than 3 months (and which persists beyond the time that tissue healing would normally be expected) are identified, assessed and managed with chronic pain as a distinct component of their diagnosis.</b></p>
<b>Quality Measure</b>	<p><b>Structure:</b> Evidence of practice policy relating to patients with a history of pain ongoing for more than 3 months, that chronic pain is identified and noted as a distinct component of their diagnosis.</p> <p><b>Process:</b> Proportion of patients presenting with a history of pain ongoing for more than 3 months in which chronic pain is recoded in their clinical notes as a distinct component of their diagnosis.</p> <p><b>Numerator:</b> the number of patients in the denominator in which chronic pain is recoded in their clinical notes as a distinct component of their diagnosis.</p> <p><b>Denominator:</b> the total number of patients presenting with a history of pain ongoing for more than 3 months.</p>
<b>Description of what the quality statement means for each audience</b>	<p><u>Service Providers</u> should ensure that they identify patients who have had pain ongoing for more than 3 months, and that chronic pain is included as a distinct component of their diagnosis.</p> <p><u>Commissioners</u> should seek evidence that chiropractors are identifying chronic pain as a distinct component of their diagnosis in patients presenting with a history of pain ongoing for more than 3 months.</p> <p><u>Patients</u> with a history of pain ongoing for more than 3 months should expect chronic pain to be identified as a distinct component of their diagnosis.</p>

## Chiropractic Quality Statement 5: Patient-Centred Care

<b>Quality Statement</b>	<b>Patients with chronic pain have the opportunity to discuss their health beliefs, concerns and preferences to inform their care. Patients are given the best available evidence, are actively involved in shared decision-making, and are supported to make fully informed choices about investigations, treatment and care that reflect what is important to them.</b>
<b>Quality Measure</b>	<p><b>Structure:</b> Evidence of practice policies and procedures with regard to patient-centred care, including giving patients the opportunity to discuss their health beliefs, concerns and preferences, before involving them in shared decision-making about care that reflects what is important to them.</p> <p><b>Process:</b> Proportion of patients with chronic pain who have had the opportunity to discuss their health beliefs, concerns and preferences, before being actively involved in shared decision-making about care that reflects what is important to them.</p> <p><b>Numerator:</b> the number of patients in the denominator who have had the opportunity to discuss their health beliefs, concerns and preferences, before being actively involved in shared decision-making about care that reflects what is important to them.</p> <p><b>Denominator:</b> the total number of patients presenting with chronic pain.</p>
<b>Description of what the quality statement means for each audience</b>	<p><u>Service Providers</u> should ensure that patients with chronic pain are provided with care that reflects what is important to them by actively involving them in shared decision-making, having provided the best available evidence and the opportunity to discuss their health beliefs, concerns and preferences.</p> <p><u>Commissioners</u> should seek evidence from Service Providers that patients with chronic pain are actively involved in shared decision-making, providing care that reflects what is important to them, after receiving the best available evidence and being able to discuss their health beliefs, concerns and preferences.</p> <p><u>Patients</u> with chronic pain should expect to be actively involved in shared decision-making about care that reflects what is important to them, after having the best available evidence explained, and having had the opportunity to discuss their own health beliefs, concerns and preferences.</p>

## Chiropractic Quality Statement 10: Monitoring and Reassessment

<b>Quality Statement</b>	<b>The needs of patients with chronic pain are continually kept under review and their care plans amended as necessary. Regular formal reassessments are carried out, at least every six months, with the use of validated outcome measures to assess pain, functional disability, psychosocial factors, and quality of life.</b>
<b>Quality Measure</b>	<p><b>Structure:</b> Evidence of practice policy with regard to the regular reassessment of patients, the use of outcome measures, and the modification of care plans.</p> <p><b>Process:</b> Proportion of patients with chronic pain who are reassessed on a regularly basis (at least every six months), including the use of outcome measures.</p> <p><b>Numerator:</b> the number of patients in the denominator who have been reassessed on a regular basis (at least every six months), including the use of outcome measures.</p> <p><b>Denominator:</b> the total number of patients presenting with chronic pain.</p>
<b>Description of what the quality statement means for each audience</b>	<p><u>Service Providers</u> should continually review patients with chronic pain and carry out regular formal reassessments (at least every six months), amending care plans as necessary. Outcome measures should be used to assess pain, functional disability, psychosocial factors, and quality of life.</p> <p><u>Commissioners</u> should expect to see evidence of regular formal reassessments of patients with chronic pain (at least every six months), and the use of validated outcome measures.</p> <p><u>Patients</u> with chronic pain should expect to be continually kept under review, with regular formal reassessments (at least every six months) and the use of patient-reported outcome measures, and have their care plans amended as necessary.</p>

## Chiropractic Quality Statement 11: Integration of Service

<p><b>Quality Statement</b></p>	<p><b>When managing patients with chronic pain, chiropractors are attentive to the involvement of other health professionals, the medications that patients are taking, and write detailed reports on their findings and management to the patient's GP. Chiropractors recognise their own limitations in pain management, and refer to other healthcare professionals, or specialist interdisciplinary pain management teams, as appropriate.</b></p>
<p><b>Quality Measure</b></p>	<p><b>Structure:</b> Evidence of practice policy with regard to recognising the involvement of other health professionals and the management that they are providing, keeping them informed of assessment and care, and the need for appropriate referrals.</p> <p><b>Process:</b> Proportion of patients with chronic pain who have had reports written to their GP detailing their findings and management.</p> <p><b>Numerator:</b> the number of patients in the denominator who have had reports written to their GP detailing their findings and management.</p> <p><b>Denominator:</b> the total number of patients presenting with chronic pain.</p>
<p><b>Description of what the quality statement means for each audience</b></p>	<p><u>Service Providers</u> should be attentive to the involvement of other health professionals, the medications that patients are taking, and write detailed reports on their findings and management to the patient's GP. They should recognise their own limitations in pain management, and refer to other healthcare professionals, or specialist interdisciplinary pain management teams, as appropriate.</p> <p><u>Commissioners</u> should seek evidence of chiropractors providing multi-disciplinary care by seeking information and collaborating with other healthcare professionals for the benefit of patients, as well as reporting and referring patients as appropriate.</p> <p><u>Patients</u> with chronic pain should expect their chiropractor to be aware of the involvement of other health professionals and what care they are receiving (including medications). They should also expect their chiropractor to write to their GP and also to refer them to another healthcare profession if they feel that is in their best interest.</p>
